

Hungry?

Everyone loves cake and now it doesn't have to come in a square or circle. Cake can be just as delicious in other shapes such as a pyramid. It is an easy process that does not take much time but an artistic eye.

Step 1: Make your favorite cake batter and bake it in either a sheet pan or a loaf pan (no taller than 24 inches). Once cooked take it out and cool entirely.

Step 2: The next thing you will want to do is make a cube. If you made the cake in a sheet pan then you will need to cut multiple square layers and put them together with frosting. This will form a cube that should be no larger than 24 inches. If the cake was made in a loaf pan then simply determine its height and then cut inward with that same measurement to make a cube.

Step 3: Then you need to determine the center of your cake cube. Once it is found cut diagonally from the center point to the bottom (you should be cutting off the corners). You should make an angle where the bottom is still a square. Do this for all four ~~sides~~^{sides}. Use your best judgment with the angles because it is cake and it is your creation.

Step 4: Pick your favorite flavor of frosting and ice the outside as desired. You now have a cake shaped like a pyramid.
